

SWAMPS

WHAT ARE THE SWAMPS?

A swamp is similar to a lake but it is much shallower. Swamps are covered with water, but this water is shallow enough to allow plants to grow, reaching the surface. Swamps are generally dominated by water tolerant trees.

WHAT ANIMALS LIVE IN SWAMPS?

- Some animals live in the low-oxygen water:(some fish, like cryfish,shrimp,tadpoles,insect larvae...

WHAT PLANTS LIVE IN SWAMPS?

- Some of the plants that live in swamps are: *Acourus american*, *Alisma* plantago, *Andropogon gerardii*...

WHAT IS THE CLIMATE OF SWAMPS?

- The weather in this biome should consist of lots of precipitation. Mostly because that keeps the swamps actually wet and also to help the plants and animals that live there because they need lots of water to remain alive. The climate should be very damp not too hot or cold. It should be around in the 60's and 50's because that keeps everything in temperature of the plants and animals to survive.
